

## Individual Reflection 2 – Andreas Magnusson

- 1) I want to learn state management with blocks in flutter.
- 2) This week I have been the product owner, so I have overseen prioritizing what to implement for this week. I have been working with getting the current location of the user, for using it for getting the weather and then in another sprint the air quality. I have also been working with an API for getting the name of the closest city of the location so we can display the location of the user in an untestable way.
- 3) I think I as well as my group we did a better job in communicating and be more efficient in planning. I also learned more how flutter worked.
